REMONTADA ENGINE

TOUCHLINE SCOUTING STATION | README & QUICK-START GUIDE

TAG. DETECT. REPORT.

An offline-first, browser-native football match logging and RAE talent scouting suite.

What this repository does

Remontada Engine is a lightweight football scouting workflow designed to capture match events, connect pitch coordinates to event logs, review potential Relative Age Effect (RAE) bias, and produce a structured scout dossier. The supplied implementation is designed to run directly in a modern browser without a build step.

Repository scope

This repository represents Phase 1 of the Remontada Ecosystem. Replace LINK_TO_YOUR_MASTER_REPO_HERE with the actual master repository URL. The full technical whitepaper should document the JSGF voice grammar, localStorage inter-process communication (IPC), RAE debiasing formulas, and polar SVG trigonometry.

Important browser note: voice recognition depends on browser support and may require network access or permissions. Do not assume every feature is fully offline in every browser configuration.

System workflow

1. Setup Match commad-center.html	2. Open Live Pitch index.html	3. Tag Action Voice or touch
6. Export A4 PDF Report output	5. Generate Report report-generatorai.html	4. Review Events CSV, undo, bookmark

Data bridge: the Live Pitch sends X/Y coordinates and match-clock information to the Command Center through localStorage. Both pages generally need to be served from a compatible origin for browser storage to be shared reliably.

1. Repository Structure

```
remontada-engine/
├── index.html                  # Live Pitch: coordinate taps + goal detection
├── commad-center.html          # Dashboard: voice input, squads, events, CSV
├── bias-detector.html          # RAE scoring and hidden-gem review
├── report-generatorai.html     # Scout report builder + PDF export
├── README.md                   # Quick-start documentation
└── LICENSE                     # MIT License
```

The filename commad-center.html is preserved exactly as supplied. If this is a typo in the actual repository, rename the file and update all references consistently.

2. Quick Start

Prerequisites

A desktop browser such as Google Chrome or Microsoft Edge. For voice tagging, grant microphone permission and verify native Web Speech API support. The application has no npm install or build step according to the supplied project description.

1. Launch the console. Clone or download the repository, then open `commad-center.html` in Chrome or Edge.
2. Initialize the match. Click New Match, enter the home and away team names, competition, and date, then click Start Match. Use Reset 11 to populate the 4-3-3 squads.
3. Connect the live pitch. Open Live Pitch in a second tab. Start the match on the pitch screen and tap the turf to capture coordinates.
4. Log events by voice or touch. Hold the voice button and say a player number plus action (for example, “Fourteen pass” or “Seven tackle”). Alternatively, select a jersey and choose Pass, Shot, Tackle, or Turnover.
5. Manage the event log. Use Bookmark Play to flag recent events for review, Undo Play to remove the last event, and Export CSV to download the log.
6. Review potential RAE bias. Open `bias-detector.html`, adjust trialist scores, or use the sample players to explore birth-month effects.
7. Generate a scout dossier. Open `report-generatorai.html`, load the demo match or paste match JSON, and select Export PDF.

Offline and browser compatibility

The static HTML files do not require a build process. However, browser speech recognition, file downloads, localStorage behavior across tabs, and offline operation can vary by browser and by how the files are opened. Test the full workflow in the target browser before matchday.

3. Matchday Data Flow

Component	Role	Key output
Command Center	Match setup, voice/manual event tagging, roster and event controls	Structured match-event log
Live Pitch	Captures pitch tap positions and goal-related interactions	X/Y coordinates and match-clock context
localStorage bridge	Shares browser-side state between pages where origin/storage rules allow	Pitch-to-console handoff
Bias Detector	Supports review of potential Relative Age Effect in trialist evaluation	Adjusted/reviewed scouting scores
Report Generator	Transforms match JSON into a structured report	PDF scout dossier

Data integrity note: RAE scoring should be treated as decision support, not an automatic verdict on a player. Validate the scoring method against representative data and avoid using birth-month adjustments as the sole basis for selection.

4. GitHub Pages Deployment

1. Push the repository to GitHub.
2. Open the repository’s Settings → Pages.
3. Under Build and deployment, choose Deploy from a branch.
4. Select branch main and folder /(root), then save.
5. After deployment completes, open the generated Pages URL and navigate to `commad-center.html`.

Expected URL pattern

```
https://<your-username>.github.io/remontada-engine/commad-center.html
```

Replace the username and repository slug with your actual GitHub Pages values. Deployment timing varies; verify the URL in the repository’s Pages settings rather than relying on a fixed delay.

5. Scalability Roadmap

Horizon	Enhancement	Feasibility / dependency
Short term	WebRTC peer-to-peer sync between pitch tablet and command-center laptop	High feasibility; requires connection setup and a signaling approach
Short term	PWA manifest and service worker for offline caching	High feasibility; service workers generally require HTTPS or localhost
Medium term	Multi-scout cloud synchronization using Firebase or Supabase	Moderate; requires authentication, data rules, and an optional cloud mode
Long term	Wyscout / Opta historical feed ingestion	Dependent on API access, licensing, and data terms

6. Troubleshooting Checklist

• Voice input does not work: Check browser support, microphone permission, and whether the browser’s speech-recognition implementation requires an internet connection.
• Pitch coordinates do not appear: Confirm both pages are opened from a compatible origin and inspect localStorage keys/events in browser developer tools.
• PDF export fails: Test the report generator with the demo match first; check browser download permissions.
• CSV is empty: Confirm that events were logged and that the correct match is active.
• GitHub Pages returns 404: Verify the repository slug, branch, root folder, filename spelling, and deployment status.

7. License

Released under the MIT License, as stated in the supplied repository description. Keep the LICENSE file in the repository and ensure its contents match the intended license before distribution.

REMONTADA ENGINE
A practical matchday workflow for logging, reviewing, and reporting football scouting observations.
